House in Ametlla de Segarra

The renovation of this former warehouse in Ametlla de Segarra transforms a traditional building into a contemporary home while preserving the essence of the place and its connection to the rural surroundings. The project combines the restoration of original materials with a new, open, and luminous spatial organization, designed to maximize natural light and create a sense of continuity between rooms. The living spaces are located on the ground floor and the bedrooms on the first floor, connected by a central opening that articulates the house and reinforces the feeling of spaciousness. The use of natural materials such as stone, wood, lime mortars, and handcrafted ceramics, along with sustainable solutions like aerothermal heating, rainwater harvesting, and photovoltaic energy, contribute to creating an efficient, warm, and environmentally friendly home.
